

Lecture 3

MATHCAD-DATA ANALYSIS FUNCTIONS

Objectives

- ◆ Graphs in MathCAD
- ◆ Built-in Functions for basic calculations:
 - Square roots,
 - Systems of linear equations
 - Interpolation on data sets
 - Linear regression
- ◆ Symbolic calculation

Graphing with MathCAD

- ◆ Plotting vector against vector:
 - The vectors must have equal number of elements.
 - MathCAD plots values in its default units.
 - To change units in the plot.....?
 - Divide your axis by the desired unit.
 - Or remove the units from the defined vectors
 - Use Graph Toolbox or [Shift-2]
 - Or *Insert/Graph* from menu

Graphing

$$\text{time} := \begin{pmatrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{pmatrix} \text{ min}$$

$$\text{Temp} := \begin{pmatrix} 20 \\ 28 \\ 35 \\ 42 \\ 49 \end{pmatrix} \text{ K}$$

$$\text{Time} := \frac{\text{time}}{\text{min}}$$

Graphing with MathCAD

- ◆ Plotting element by element: define a range variable containing as many element as each of the vectors.
- ◆ $i:=0..4$

$$\text{time} := \begin{pmatrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{pmatrix} \text{ min} \qquad \text{Temp} := \begin{pmatrix} 20 \\ 28 \\ 35 \\ 42 \\ 49 \end{pmatrix} \text{ K}$$

$i := 0..4$

QuickPlots

- ◆ Use when you want to see what a function looks like
- ◆ Create a x-y graph
- ◆ Enter the function on y-axis with parameter(s)
- ◆ Enter the parameter on x-axis

$x := 0, 0.1..2\pi$

Graphing with MathCAD

- ◆ Plotting multiple curves: up to 16 curves in a single graph.
- ◆ Example: For 2 dependent variables (y) and 1 independent variable (x)
 - Press shift2 (create a x-y plot)
 - On the y axis enter the first y variable then press comma to enter the second y variable.
 - On the x axis enter your x variable.

Multiple curves

$x := 0, 0.1..2\pi$

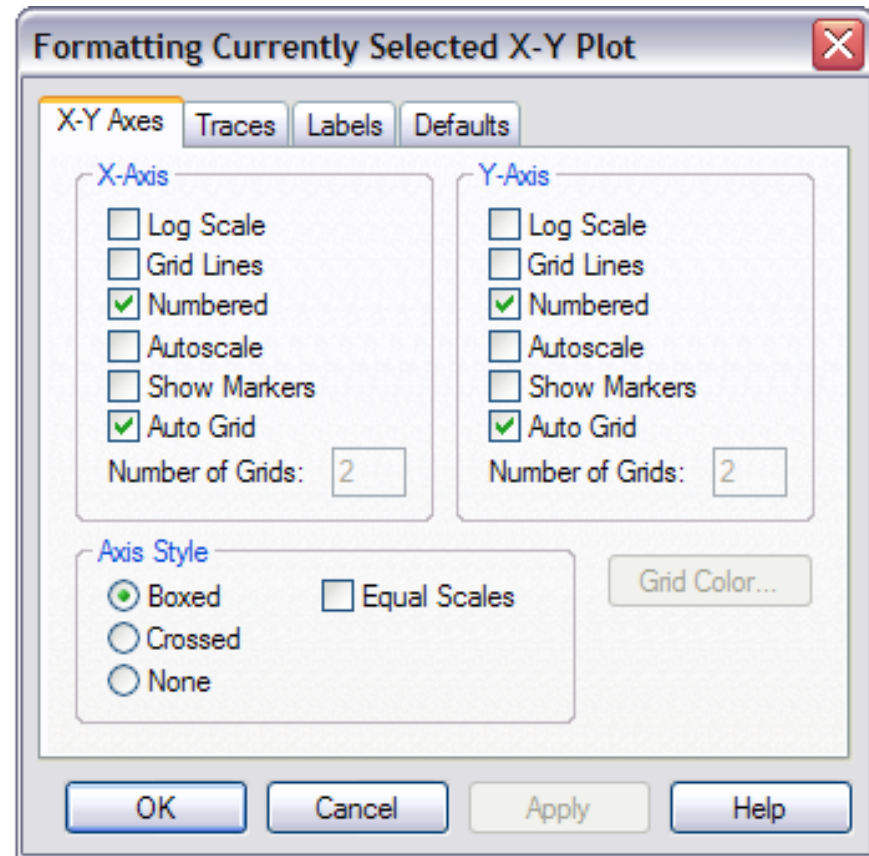

time := $\begin{pmatrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{pmatrix}$ Temp := $\begin{pmatrix} 20 \\ 28 \\ 35 \\ 42 \\ 49 \end{pmatrix}$ pressure := $\begin{pmatrix} 25 \\ 30 \\ 35 \\ 40 \\ 45 \end{pmatrix}$

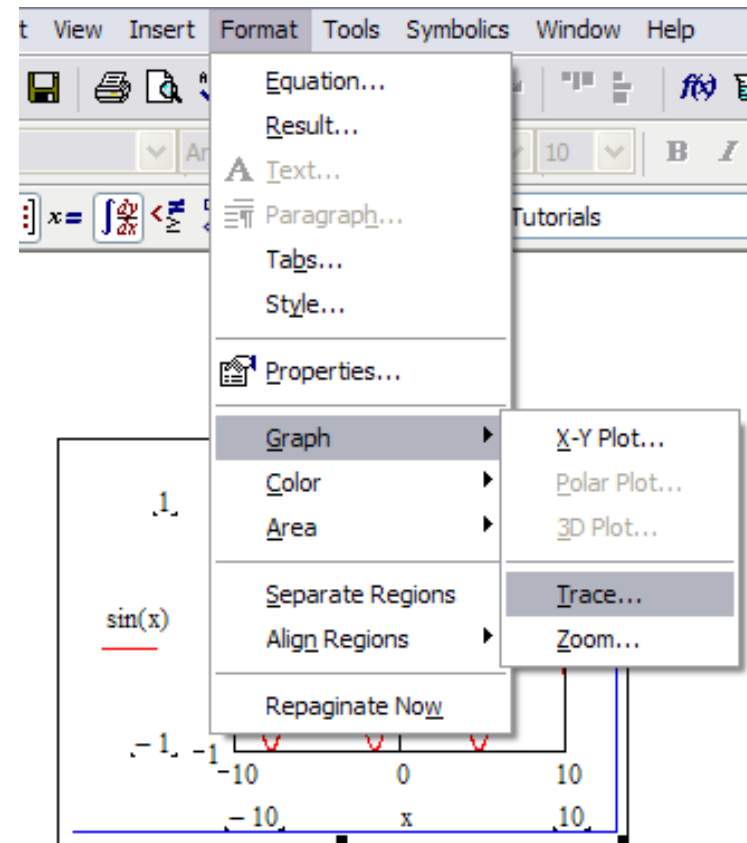

Modify Graphical Display

- ◆ Double-click anywhere on the graph
- ◆ Can change the *axis* characteristics
- ◆ Can change the *trace* characteristics
- ◆ Can add text and position of *labels*

Read data from the graph

- ◆ Click anywhere on the graph
- ◆ Choose Format/Graph/Trace from menu
- ◆ Click on any point on the curve to get x and y values

Read data from the graph

X-Y Trace

X-Value

Y-Value

Track Data Points

Make a Polar Plot of $\cos\left(\frac{3}{2}\theta\right)$

where the range of θ is from
 -2π to 2π with an increment of 0.1 .

3D Plots

- ◆ Define the matrix of elements to plot
- ◆ Choose *Insert/Graph/Surface plot* from menu
- ◆ Place the name of the matrix in the placeholder

$$M := \begin{pmatrix} 1 & 1 & 10 \\ 2 & 2 & 12 \\ 3 & 3 & 14 \\ 4 & 4 & 16 \\ 5 & 5 & 18 \end{pmatrix}$$

Make (a) a 3-D surface plot filled with grayscale color map and (b) a contour plot of the matrix T .

$$T = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 12 & 27 & 43 & 46 & 42 & 21 & 0 \\ 0 & 22 & 52 & 100 & 100 & 100 & 42 & 0 \\ 0 & 25 & 57 & 100 & 100 & 100 & 46 & 0 \\ 0 & 22 & 52 & 100 & 100 & 100 & 42 & 0 \\ 0 & 12 & 27 & 43 & 46 & 42 & 21 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Built-in functions

- ◆ **Calculation of square roots:**
- ◆ use `root (y(x1),x1)`, where `x1` is guess value.
- ◆ `root (y(x1), x1)` finds root of a function by approximation to the root value.
- ◆ if the expression has multiple roots, try different guess values

Calculate the roots of $ax^2+bx+c=0$
where $a = 1$, $b = 3$ and $c = -2$

$$a := 1$$

$$b := 3$$

$$c := -2$$

$$f(x) := a \cdot x^2 + b \cdot x + c$$

$$x1 := 1$$

$$x2 := -3$$

$$\text{soln1} := \text{root}(f(x1), x1)$$

$$\text{soln2} := \text{root}(f(x2), x2)$$

$$\text{soln1} = 0.562$$

$$\text{soln2} = -3.562$$

Built-in functions

- ◆ To solve a linear systems of equations:

- ◆ $[C] \cdot [x] = [r]$

$$C := \begin{pmatrix} 2 & 3 & 1 \\ 1 & 4 & 7 \\ 3 & 7 & 7 \end{pmatrix} \quad r := \begin{pmatrix} 12 \\ 16 \\ 18 \end{pmatrix}$$

- ◆ use $[x] := [C]^{-1} \cdot [r]$

- ◆ use `lsolve`:

- `x:=lsolve(C,r)`

$$x := \text{lsolve}(C, r)$$

$$x = \begin{pmatrix} 34 \\ -22 \\ 10 \end{pmatrix}$$

Built-in functions

- ◆ **Statistical Functions:** $\text{mean}(A)$, $\text{var}(A)$, $\text{stdev}(A)$.
- ◆ **Curve Fitting:**
 - Linear regression
 - Specialized regression equations: Exponential, power, sin, etc.

Curve fitting

- ◆ `slope(x,y)` returns the slope of line that best fits data in **x** and **y**.
- ◆ `intercept(x,y)` returns the intercept line that best fits data in **x** and **y**.
- ◆ `corr(x,y)` returns the correlation coefficient of the elements in **x** and **y**. (tells you how good or bad is the fit)

$$x := \begin{pmatrix} 0 \\ 1 \\ 3 \\ 4 \end{pmatrix}$$

$$y := \begin{pmatrix} 0 \\ 2.6 \\ 23.16 \\ 27.57 \end{pmatrix}$$

$$m := \text{slope}(x, y)$$

$$m = 7.57$$

$$\text{corr}(x, y) = 0.984$$

$$c := \text{intercept}(x, y)$$

$$c = -1.808$$

$$f(x) := m \cdot x + c$$
